The **cobas**® HPV Test

The only clinically validated, FDA-approved assay that simultaneously provides pooled results on high-risk genotypes and individual results on highest-risk genotypes HPV 16 and 18. **This single test:**

- Provides 3 results from a 1 mL sample.
- Demonstrated proven performance, based on the ATHENA Study*, where ~ 1 in 10 women aged 30+ who tested positive for HPV 16 and/or 18 had high-grade cervical disease, despite normal Pap results.¹
- Exhibits sensitivity and specificity comparable to current methodology for pooled high-risk HPV testing in women with ASC-US cytology.¹

When ordering hrHPV testing for ASC-US triage or screening women aged 30+, remember that only the **cobas**® HPV Test provides simultaneous HPV 16 & 18 results along with other high-risk types...because the devil is in the details.

12 pooled hrHPV
